Amendments to the Specification:

Please replace line 31, page 2 with the following:

The print stream created by the main application is generally in the form of text data, though it may take on other forms. The data [must]may be parsed and checked before format correction and barcoding techniques can be directed to the addresses in the text for creation of a mailpiece.

Please replace first paragraph, page 12 with the following:

From step 222, the method advances essentially simultaneously to steps 224 and 228. Step 224 exists as a separate envelope kernel and user mode where an envelope printer device language (PDL) is generated for filing before advancing to step 226 where the envelope print data is placed in a temporary file. The method advances from step 226 to step 234 where the envelope PDL data file is read and then injected at step 236 back into the print stream before advancing to step 238 where the sequence ends while the print stream is directed toward another peripheral device such as a document printer.
